[Introduction](#page-1-0)

<span id="page-1-0"></span>Definition (Linear Homogeneous Partial Differential Equation of Order 
$$
n
$$
)

An equation of the type

<span id="page-1-1"></span>
$$
a_0 \frac{\partial^n z}{\partial x^n} + a_1 \frac{\partial^n z}{\partial x^{n-1} \partial y} + a_2 \frac{\partial^n z}{\partial x^{n-2} \partial y^2} +, \dots, a_n \frac{\partial^n z}{\partial y^n} = \phi(x, y),
$$
\n(1)\nwhere  $a_0$ ,  $a_1$ ,  $a_n$  are constants, and  $\phi(x, y)$  is any function

where  $a_0, a_1, \ldots, a_n$  are constants and  $\phi(x,y)$  is any function of  $x$  and  $y$ , is called a "**homogeneous linear partial differential equation of order**  $n$ " with constant coefficients. It is called homogeneous because all the terms contain derivatives of the same order.

[Introduction](#page-1-0)

<span id="page-2-0"></span>Notations: We use the following notations:

Then equation [\(1\)](#page-1-1) can be written as

$$
\frac{\partial}{\partial x} = D \text{ and } \frac{\partial}{\partial y} = D'
$$

 $a_0D^nz + a_1D^{n-1}D'z + a_2D^{n-2}D'^2z + \ldots + a_nD'^n z = \phi(x, y)$ or

$$
(a_0D^n + a_1D^{n-1}D' + a_2D^{n-2}D'^2 + \dots + a_nD'^n)z = \phi(x, y)
$$

or

$$
F(D, D')z = \phi(x, y),
$$

where

$$
F(D, D') = (a_0 D^n + a_1 D^{n-1} D' + a_2 D^{n-2}_{\{1,2\}} D'^2_{\{2\}} + \ldots \pm a_n D'^n)_{\{1,2\}}.
$$

[Introduction](#page-1-0)

## Working Rule to find Complementary Functions:

**Step-I:** Put the given equation in the standard form

<span id="page-3-1"></span>
$$
(a_0D^n + a_1D^{n-1}D' + a_2D^{n-2}D'^2 + \dots + a_nD'^n)z = \phi(x, y)
$$
\n(2)

**Step-II:** Replacing D by m and D' by 1 in the equation [\(2\)](#page-3-1), we obtain auxiliary equation (A.E.) as

<span id="page-3-2"></span>
$$
a_0m^n + a_1m^{n-1} + a_2m^{n-2} + \dots + a_n = 0 \tag{3}
$$

 $\Omega$ 

**Step-III:** Solve equation [\(3\)](#page-3-2) for  $m$ . Then following cases will be arises:

> Dr. G.K. **Prajapati**

LNJPIT, **Chapra** 

[Introduction](#page-1-0)

**Case-1:** Let  $m = m_1, m_2, ..., m_n$  are different roots, then complementary function (C.F.) will be

$$
C.F. = f_1(y + m_1x) + f_2(y + m_2x) + \dots + f_n(y + m_nx),
$$

where  $f_1, f_2, ..., f_n$  are arbitrary functions. **Case-2:** Let r roots  $m = m_1 = m_2 = ... = m_r, (r \leq n)$  are equal, then complementary function (C.F.) will be

 $C$ .  $F =$  $f_1(y+mx)+xf_2(y+mx)+x^2f_3(y+mx)+...+x^{r-1}f_r(y+mx).$ 

**Case-3:** Corresponding to a non-repeated factor  $D$ , the C.F. is taken as  $f_1(y)$ .

**Case-4:** Corresponding to a repeated factor  $D^r$ , the C.F. is taken as

$$
f_1(y) + x f_2(y) + x^2 f_3(y) + \ldots + x^{r-1} f_r(y).
$$

 $2Q$ 

<span id="page-5-0"></span>

> Dr. G.K. **Prajapati**

LNJPIT, **Chapra** 

[Introduction](#page-1-0)

**Case-5:** Corresponding to a non-repeated factor  $D'$ , the C.F. is taken as  $f_1(x)$ .

**Case-6:** Corresponding to a repeated factor  $D'^{r}$ , the C.F. is taken as

$$
f_1(x) + yf_2(x) + y^2f_3(x) + \dots + y^{r-1}f_r(x).
$$

Notations: We use the following notations

$$
p = \frac{\partial z}{\partial x}, q = \frac{\partial z}{\partial y}, r = \frac{\partial^2 z}{\partial x^2}, s = \frac{\partial^2 z}{\partial x \partial y}, t = \frac{\partial^2 z}{\partial y^2}.
$$

[Introduction](#page-1-0)

#### Example

Solve 
$$
\frac{\partial^3 z}{\partial x^3} - 7 \frac{\partial^3 z}{\partial x \partial y^2} + 6 \frac{\partial^3 z}{\partial y^3} = 0
$$

**Solution:** The given partial differential equation can be written as

$$
(D^3 - 7DD'^2 + 6D'^3)z = 0.
$$

By replacing D by m and  $D'$  by 1, the auxiliary equation is

$$
m^3 - 7m + 6 = 0 \implies (m-1)(m-2)(m+3) = 0.
$$

Hence the roots are  $m = 1, 2, -3$ , which are different. Therefore general solution will be

$$
z = f_1(y+x) + f_2(y+2x) + f_3(y-3x),
$$

where  $f_1, f_2, f_3$  are arbitrary function[s.](#page-5-0)  $OQ$ Dr. G.K. Prajapati LNJPIT, Chapra [Homogeneous Linear Partial Differential ...](#page-0-0)

<span id="page-7-0"></span>

> Dr. G.K. **Prajapati**

LNJPIT, **Chapra** 

**[Introduction](#page-1-0)** 

#### Example

Solve 
$$
(D^3 - 6D^2D' + 11DD'^2 - 6D'^3)z = 0
$$

**Solution:** By replacing D by m and D' by 1, the auxiliary equation is

$$
m^3 - 6m^2 + 11m - 6 = 0 \implies (m-1)(m-2)(m-3) = 0.
$$

Hence the roots are  $m = 1, 2, 3$ , which are different. Therefore general solution will be

$$
z = f_1(y+x) + f_2(y+2x) + f_3(y+3x),
$$

 $OQ$ 

where  $f_1$ ,  $f_2$ ,  $f_3$  are arbitrary functions.

> Dr. G.K. **Prajapati**

LNJPIT, **Chapra** 

**[Introduction](#page-1-0)** 

#### Example

Solve the partial differential equation  $25r - 40s + 16t = 0$ 

**Solution:** Given equation can be written as  $(25D^2 - 40DD' + 16D'^2)z = 0.$ 

By replacing D by m and D' by 1, the auxiliary equation is

$$
25m^2 - 40m + 16 = 0 \implies (5m - 4)^2 = 0.
$$

Hence the roots are  $m = 4/5, 4/5$ , which are repeated. Therefore general solution will be

$$
z = f_1(y + \frac{4}{5}x) + x f_2(y + \frac{4}{5}x)
$$

or

$$
z = f_1(5y + 4x) + x f_2(5y + 4x)
$$

where  $f_1, f_2, f_3$  are arbitrary function[s.](#page-7-0)  $OQ$ Dr. G.K. Prajapati LNJPIT, Chapra [Homogeneous Linear Partial Differential ...](#page-0-0)

> Dr. G.K. **Prajapati**

LNJPIT, **Chapra** 

[Introduction](#page-1-0)

#### Example

**Solution:** The solution corresponding to the factor  $D^2$  is  $f_1(y) + x f_2(y)$ 

Solve the partial differential equation  $D^2 D'^2 (D + D') z = 0$ 

The solution corresponding to the factor  $D^{\prime 2}$  is  $f_3(x)+yf_4(x)$ The solution corresponding to the factor  $(D+D')$  is  $f_5(y-x)$ Hence the general solution will be

$$
z = f_1(y) + x f_2(y) + f_3(x) + y f_4(x) + f_5(y - x).
$$

### Exercise

Solve the following PDE:

(1) 
$$
(4D^2 + 12DD' + 9D'^2)z = 0
$$
  
\n(2)  $(D^3 - 4D^2D' + 4DD'^2)z = 0$   
\n(3)  $(D^4 - 2D^3D' + 2DD'^3 - D'^4)z = 0$   
\n(4)  $r = a^2t$   
\n(5)  $2r + 5s + 2t = 0$
